## SUMMARY

Industrial and Manufacturing Engineer who works where the **floor, the automation and the data** meet. Has cut **downtime 25%, cost 18% and scrap 10%**, carried a capital project from business case to rated output, and writes the **SQL and Python** behind his own analysis. Completing an MS in Industrial Engineering in December 2026.

## EDUCATION

**Master of Science in Industrial Engineering** — **Dec 2026**
*Northeastern University, Boston* — 3.62 GPA

**Bachelor of Engineering in Mechanical Engineering** — **Jul 2020**
*Savitribai Phule Pune University, India* — 3.3 GPA

## SKILLS

**Process:** Time Study, Bottleneck Analysis, Capacity, Throughput, Cycle Time, Layout, Material Flow, Standard Work
**Quality:** PFMEA, Control Plans, SPC, Process Capability, Root Cause Analysis, Corrective Action, ISO 9001, Minitab
**Automation & Systems:** Robotic Fleets, Vision Systems, Equipment Qualification, IQ/OQ/PQ, WMS (Manhattan Active, PKMS)
**Data & Delivery:** Power BI, Advanced Excel, SQL, Python, Business Case, Cost Estimating, Commissioning, Lean, Six Sigma

## PROFESSIONAL EXPERIENCE

**Supply Chain - Industrial Engineer Intern: Staples Inc, Framingham, MA** — **Jan 2026 – Sep 2026**

- Questioned a replenishment threshold that nobody had revisited in years and cut the restocking trips by **30%**
- Recovered more than **40 pallet positions** by rethinking the layout and the staging right across the whole floor
- Owned the **robotic fleets, the goods-to-person flow and all the vision systems** across the whole fulfilment network
- Diagnosed the automation faults that nobody else on that whole site could place and restored the fleet to full production
- Deployed a fleet-wide software fix across more than **250 units** without ever losing a single shift of production
- Configured the **path layouts, the stop points and the route parameters** that governed how the whole fleet moved
- Consolidated more than **650 reports** onto a single **Power BI** platform so that every site finally read the same numbers
- Corrected more than **400 records** before building anything, because nobody ever acts on a number they distrust
- Wrote **SQL and Python** to answer the operational questions that the standard reporting could not reach at all
- Cut the ergonomic risk on all the repeated manual tasks that were quietly costing that site its most experienced people
- Rewrote the **SOPs and the work instructions** so that every gain still held long after I had left the site entirely
- Carried an entire client site from the equipment installation through the commissioning to full rated production
- Trained the operators and the supervisors alike on every single change, which is exactly why each one of them stuck
- Covered the operations, engineering, quality, procurement and the technology work as the only engineer on site
- Proved every change on one unit, then on three, then across the fleet, so nothing ever scaled before it had worked

**Manufacturing Engineer: AB Enterprises, India** — **Dec 2021 – Aug 2024**

- Built a **PFMEA** that caught two separate failure modes which the existing inspection checks could not detect
- Cut the **rework by 10%** and the **unplanned downtime by 25%** through sustained root cause work on the floor
- Took a full **18%** out of the unit cost through the process and the material decisions that I made and owned myself
- Cut the **inventory holding cost by 30%** while still protecting the service level on every single order that was placed
- Applied **SPC and process capability** to all the critical characteristics and steadily reduced the variation over time
- Qualified more than 3 new suppliers and held every one of them to **95%+ on-time delivery** across the order book
- Hired and trained more than **24 people**, building the team that went on to run that plant on every production shift
- Wrote the safety standard and the procedures that the whole plant worked to through every single production shift

## PROJECTS

**Greenfield Plant Build, $120K Capital Project - AB Enterprises (2023)**

- Traced the cycle constraint to the sulfuric anodising stage and specified two tanks running in parallel to break it open
- Built the second line alongside the existing plant so that not a single shift of production was ever lost to the build
- Lifted the site capacity from **700kg to 1,700kg per day** and delivered the whole **$120K** project to the agreed budget

**JARVIS and Job Application Tracker (Python, JavaScript, Next.js, TypeScript, SQLite)**

- Built a **9,600-line** system integrating 6 ATS APIs across 155 separate job boards, running end to end unattended
- Indexed **34,039 Department of Labor filings** into a searchable sponsorship history, queried before every application
- Measured before building: 56 parked questions proved to be 21 distinct ones, and four of those were a single apostrophe bug
